

Business Requirements Document (BRD)

Zepto Delivery Tracking Enhancement

Document Version: 1.0

Prepared By: Arpita Singh

Date: 01 August 2026

Document Type: Business Requirements Document

1. Introduction

1.1 Purpose

The purpose of this document is to define the business requirements for enhancing the delivery tracking experience in the Zepto mobile application.

The proposed enhancement aims to provide customers with better visibility into the delivery progress of their orders by introducing delivery partner location tracking during the "Out for Delivery" stage.

1.2 Background

The current delivery tracking experience primarily provides customers with an estimated delivery time or countdown. While this gives an approximate delivery window, it does not provide sufficient visibility into the actual progress of the delivery.

The proposed solution will enhance the existing tracking experience by providing customers with a map-based view of the delivery partner's approximate location and delivery progress.

Note: This is a portfolio case study based on personal observation of the user experience and does not represent internal Zepto requirements or data.

2. Business Objective

The objectives of the proposed enhancement are:

- Improve transparency during the delivery process.
- Provide customers with better visibility into delivery progress.

- Reduce uncertainty caused by inaccurate or changing ETA information.
- Improve the overall delivery tracking experience.
- Provide customers with additional context when delivery is delayed.

3. Scope

3.1 In Scope

The proposed enhancement includes:

- Displaying a map-based delivery tracking interface.
- Showing the approximate location of the delivery partner once the order is out for delivery.
- Displaying the customer's delivery location on the map.
- Displaying delivery status along with the map.
- Continuing to display the estimated delivery time.
- Updating the delivery partner's approximate location periodically.
- Displaying an appropriate message when the delivery partner's location cannot be retrieved.

3.2 Out of Scope

The following are outside the scope of this enhancement:

- Changes to the order placement process.
- Changes to payment functionality.
- Changes to delivery partner allocation.
- Changes to inventory or warehouse operations.
- Navigation functionality for delivery partners.
- Exact real-time tracking guarantees.
- Changes to the overall delivery network.

4. Stakeholders

Stakeholder	Role / Interest
Customer	Views delivery progress and estimated arrival
Delivery Partner	Shares location information during delivery
Product Team	Defines and prioritizes the enhancement
Development Team	Implements the tracking functionality
QA Team	Tests tracking functionality and edge cases
Customer Support	Handles delivery-related customer queries
Business / Operations Team	Monitors delivery experience and operational impact

5. User Personas

Primary User - Customer

A customer who has placed an order and wants to understand the progress of the delivery.

Needs:

- Know whether the order is progressing.
- Understand approximately where the delivery partner is.
- Estimate when the order will arrive.
- Receive clear information when delays occur.

Secondary User - Delivery Partner

A delivery partner responsible for delivering the customer's order.

Needs:

- Location sharing to function during the delivery journey.
- Minimal additional interaction with the application.
- Ability to complete the delivery without unnecessary interruptions.

6. Business Requirements

BR-01: Delivery Location Visibility

The system should provide customers with a map-based view of the delivery partner's approximate location once the order reaches the "Out for Delivery" stage.

BR-02: Delivery Status

The system should display the current delivery status along with the tracking information.

Example statuses:

- Order Confirmed
- Preparing
- Partner Assigned
- Out for Delivery
- Delivered

BR-03: Customer Location

The customer's delivery location should be represented on the tracking map.

BR-04: Delivery Partner Location

The system should periodically update the approximate delivery partner location while the order is being delivered.

BR-05: ETA Display

The existing estimated delivery time/countdown should continue to be displayed alongside the tracking information.

BR-06: Location Unavailable

If the delivery partner's location cannot be retrieved, the system should display an appropriate message instead of showing outdated or misleading location information.

Example: "Delivery partner location is currently unavailable. Your order is still on the way."

BR-07: Delivery Completion

Once the order is delivered, live tracking should stop and the system should display the final delivery status.

7. Business Rules

1. Delivery partner location should only be visible during an active delivery.
2. Location tracking should begin when the order enters the "Out for Delivery" stage.
3. Location tracking should stop once the order is delivered or cancelled.
4. The system should not display stale location information as current location.
5. If location information is unavailable, the system should display a clear status message.
6. Customers should only have access to tracking information for their own orders.

8. Assumptions

The following assumptions have been made for this case study:

- Delivery partners use a mobile application capable of sharing location information.
- Customers have access to the existing order tracking screen.
- The application can retrieve location information from the delivery partner's device.
- Customers have an active internet connection while viewing the tracking map.
- Location information is approximate and may not always represent the exact current position.

9. Risks & Dependencies

Risks

- Poor network connectivity may delay location updates.
- GPS inaccuracies may result in approximate or outdated locations.
- Continuous location tracking may have battery and performance implications.
- Incorrect location data could create customer confusion.

Dependencies

- Delivery partner location services.
- Maps/location API.
- Backend services for receiving and transmitting location information.
- Mobile application tracking interface.
- Privacy and security controls for location data.

10. Success Criteria

The proposed enhancement can be evaluated using the following indicators:

- Increased usage of the delivery tracking screen.
- Reduction in customer uncertainty regarding delivery progress.
- Reduction in delivery-status-related support queries.
- Improved customer satisfaction with the delivery tracking experience.
- Reliable availability of delivery location information during active deliveries.

Note: Actual targets and metrics would be defined by the product/business team using production data.
