

Background

Quick-commerce customers often expect visibility into their order during the final delivery stage, particularly when delivery times are short and time-sensitive.

Problem Statement

Based on my experience using Zepto, the tracking experience primarily relies on an estimated delivery countdown rather than showing the delivery partner's location on a map. When the estimated time changes or is inaccurate, customers are left uncertain about when their order will actually arrive, which can lead to frustration.

User Pain Points

1. Limited visibility into delivery partner's location
2. ETA/countdown may not always reflect actual arrival time
3. Difficulty judging whether the order is nearby
4. Uncertainty while waiting for time-sensitive orders
5. Potential need to repeatedly check order status

Current State Analysis

Impact

1. Reduced sense of delivery visibility
2. Customer uncertainty
3. Increased frustration
4. Potentially more order-status checking
5. Potentially increased "Where is my order?" support interactions
