

The wireframes demonstrate the proposed delivery tracking experience and key exception state identified during the requirements analysis.

Note: These wireframes are proposed designs created as part of this Business Analysis case study and do not represent official Zepto designs.

1. Current State: Delivery Tracking

Observation: The customer can view delivery status and ETA but does not have visibility into the delivery partner's current location.

2. Proposed State: Live Delivery Tracking

Proposed Enhancement: Provides map-based visibility of the delivery partner's approximate location along with delivery status and ETA.

3. Exception State: Location Unavailable

Exception Handling: When location information is unavailable, the customer is informed clearly while continuing to receive available order status and ETA information.
